

Amazon has several flavors of wires. Some folks like using wires that are all the same length and have finished ends so that you don't need to cut or strip them. I think the extra length of these wires looks messy. This recommendation uses a selection of pre-cut wires in various lengths.

Wires: https://www.amazon.com/AUSTOR-Lengths-Assorted-Preformed-Breadboard/dp/B07CJYSL2T/ref=sxin_2_ac_d_rm?ac_md=1-1-YnJlYWRib2FyZCBqdW1wZXlkd2lyZXM%3D-ac_d_rm&cv_ct_cx=breadboard&keywords=breadboard&pd_rd_i=B07CJYSL2T&pd_rd_r=c1f9de11-62b7-4f31-8fc7-32b5567f52fc&pd_rd_w=Ht3Jq&pd_rd_wg=9w4Eq&pf_rd_p=ec111f65-4a46-499c-be78-f47997212bd0&pf_rd_r=VFTW5M7AMSZQET4CW193&psc=1&qid=1582392870

If you'd like to really trim the wires to just the right length, you may also need a wire cutter/stripper. It should go down to 22 AWG wire. There are several at Amazon, this one looks good:

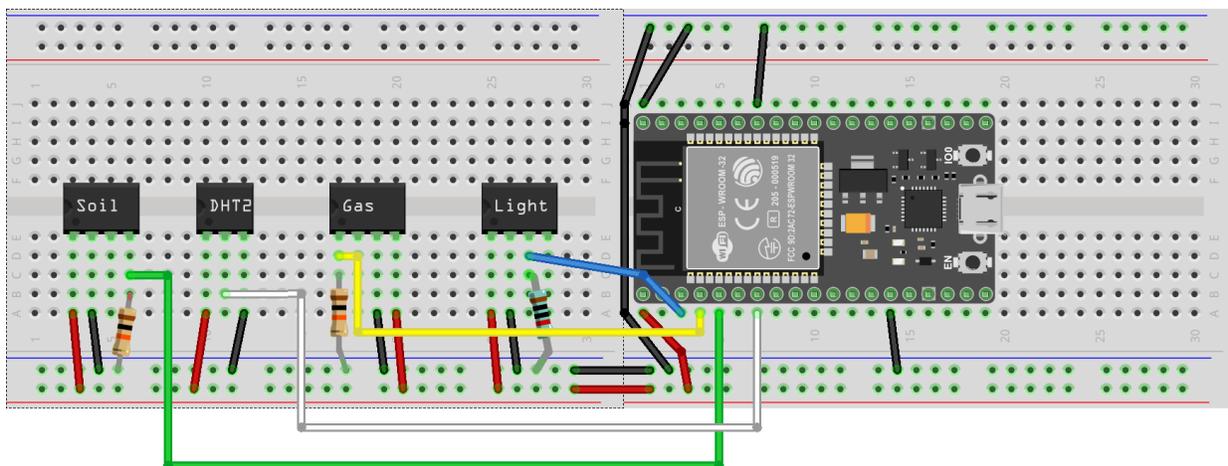

https://www.amazon.com/dp/B082KL14QP/ref=dp_cerb_1

3 10K ohm resistors (use 10K resistors from this kit): https://www.amazon.com/Resistors-Assortment-Tolerance-Excellently-Breadboards/dp/B07D2Z45CG/ref=sr_1_2_sspa?keywords=resistor+kit&qid=1582393289&s=industrial&sr=1-2-

[spons&psc=1&spLa=ZW5jcnlwdGVkUXVhbGlmaWVyPUEwMDQ5MDQ5MjRmUDZJQ1BBODZPVyZ3aWRnZXROYW1lPXNwX2F0ZiZlY3Rpb249Y2xpY2tSZWRpcmVjdCZkb05vdExvZ0NsaWNrPXRydWU=](https://www.amazon.com/Resistors-Assortment-Tolerance-Excellently-Breadboards/dp/B07D2Z45CG/ref=sr_1_2_sspa?keywords=resistor+kit&qid=1582393289&s=industrial&sr=1-2-spons&psc=1&spLa=ZW5jcnlwdGVkUXVhbGlmaWVyPUEwMDQ5MDQ5MjRmUDZJQ1BBODZPVyZ3aWRnZXROYW1lPXNwX2F0ZiZlY3Rpb249Y2xpY2tSZWRpcmVjdCZkb05vdExvZ0NsaWNrPXRydWU=)

2 half-length breadboards: https://www.amazon.com/HiLetgo-Solderless-Breadboard-Circuit-Prototyping/dp/B00LSG5BJK/ref=sxin_2_ac_d_rm?ac_md=4-3-bWluaSBicmVhZGJvYXJk-ac_d_rm&cv_ct_cx=breadboard&keywords=breadboard&pd_rd_i=B00LSG5BJK&pd_rd_r=f9e7856e-d8ee-4810-a038-3d0a29453491&pd_rd_w=ErQs1&pd_rd_wg=73CET&pf_rd_p=ec111f65-4a46-499c-be78-f47997212bd0&pf_rd_r=R086KGQ6P9TGDY8HDVQW&psc=1&qid=1582392692

Here are the schematics. Note that we used two half-length breadboards abutted together. The ESP32 is placed so that most of the pins we use directly match the breadboard pin numbers. The ESP32 is also placed so that the sensors do not interfere with the USB cable.

fritzing

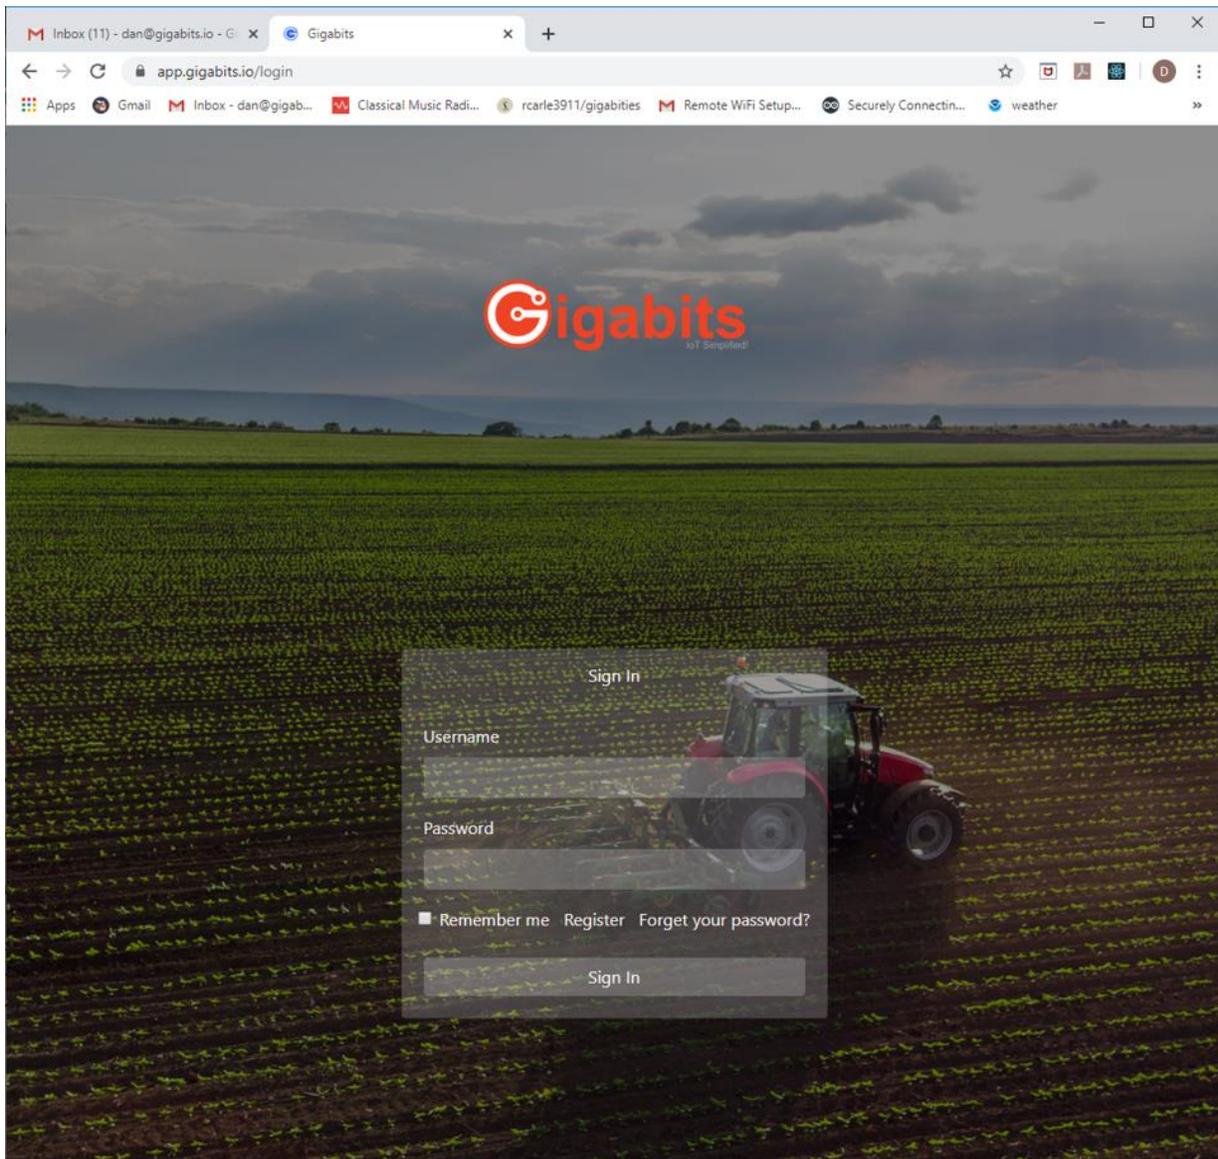

There are many ways the Espressif ESP32 module can be mounted on a “breakout board” or “development board.” The rules governing how the ESP32 module’s General Purpose IO (GPIO) pins

are mapped to the HiLetgo ESP32S board are complex. You may want to reference <https://randomnerdtutorials.com/esp32-pinout-reference-gpios/> to see how the pins are used by the ESP32 module. You may also want to reference <https://forum.fritzing.org/t/esp32s-hiletgo-dev-board-with-pinout-template/5357> to see how the module pins are mapped to the HiLetgo ESP32S development board.

Half the fun of IoT is experimenting with different sensors. A selection of other sensors can be seen on https://www.amazon.com/s?k=arduino+sensor&ref=nb_sb_noss_1. There are many ways to connect sensors to a microprocessor. Since this is an introductory project, let's keep things simple by only showing how to replace one of the existing sensors with a new sensor that has the same number of pins. If your original and replacement sensors each have 3 pins, the red wire in the original sensor should attach to a pin on the replacement sensor labelled "VCC" or "+". The black wire should connect to a pin labelled "GND" or "-". The white wire should connect to the pin labelled something like "DATA", "SIG", "S" or "OUT". When replacing a sensor that has 4 pins, connect to original sensor's red wire to the new sensor's "VCC" pin. The black wire should go to the pin labelled "GND" and the colored wire should go to the pin labelled "AO". Make sure that your new sensor has pins with these labels.

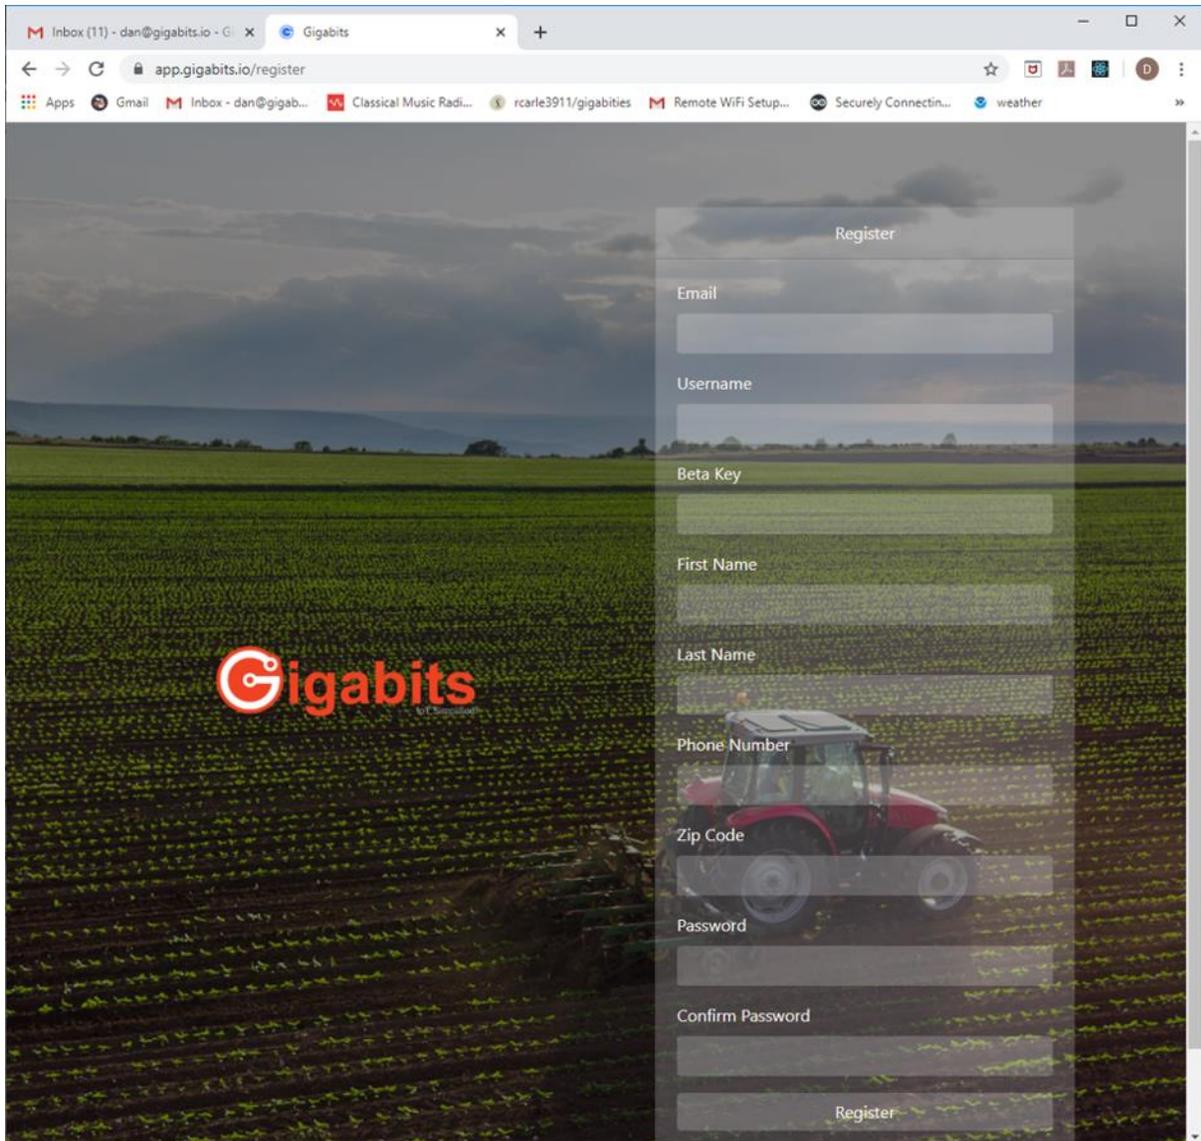

Installing Gigabits IoT Platform ESP32 software

Software Step 1: Open a web browser and go to “app.gigabits.io”.

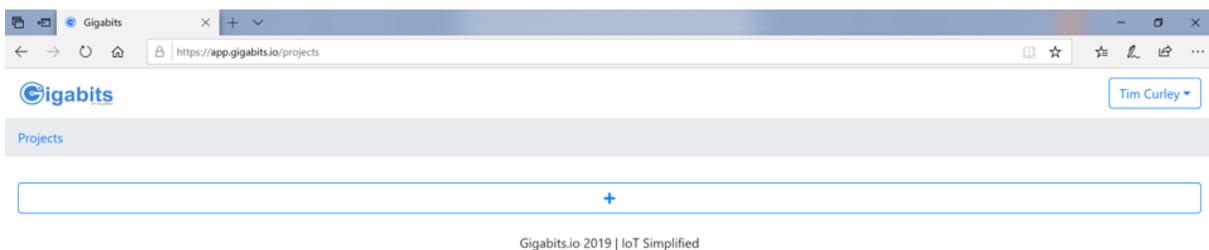

Software Figure 1

Software Step 2: If you haven't registered with Gigabits yet, use your Beta Key to register now.

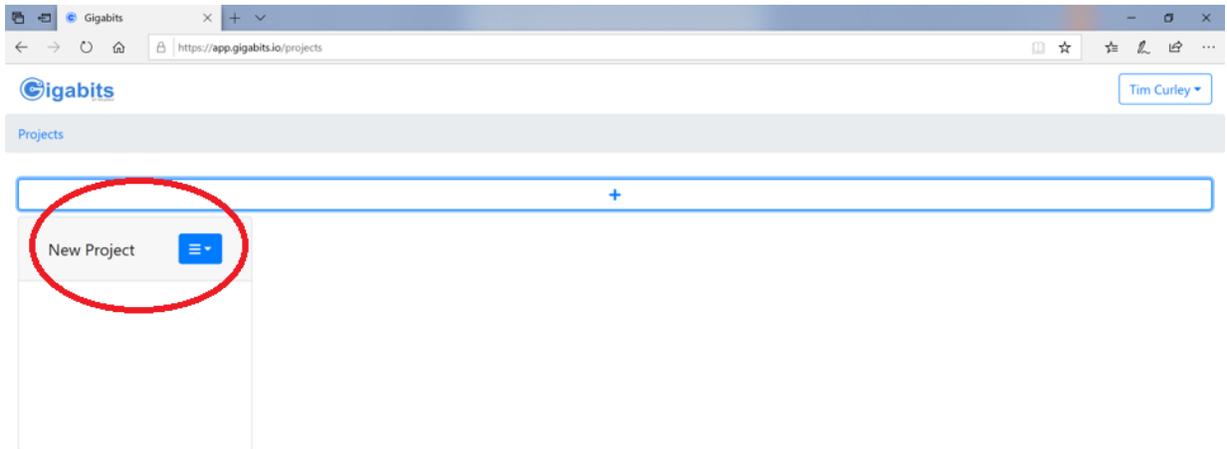

Software Figure 2

Software Step 3: Once you've registered, go back to app.gigabits.io and sign in.

Software Figure 3

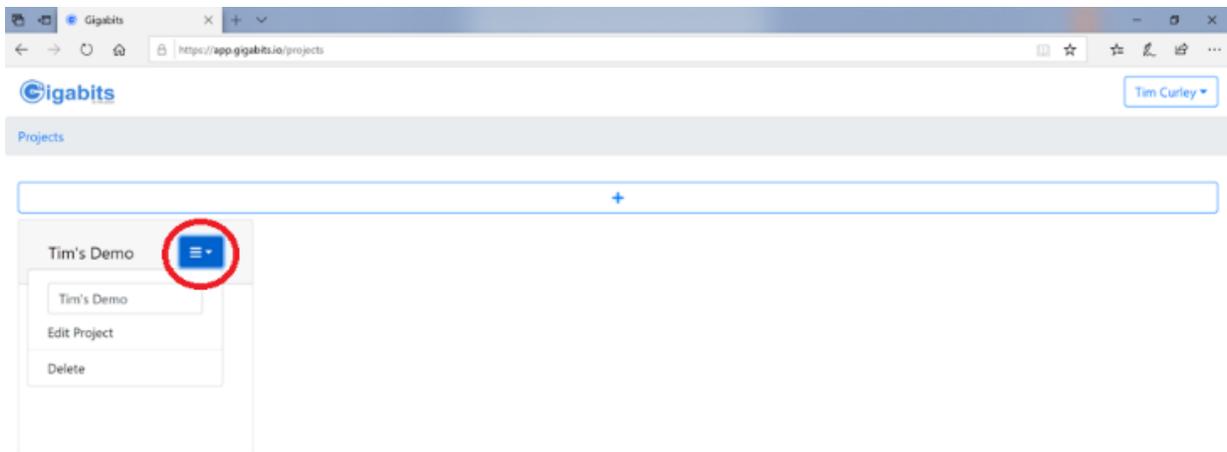

Software Step 4: Create a new project by selecting the plus sign. This will create a project named "New Project"

Gigabits.io 2019 | IoT Simplified

Software Figure 4

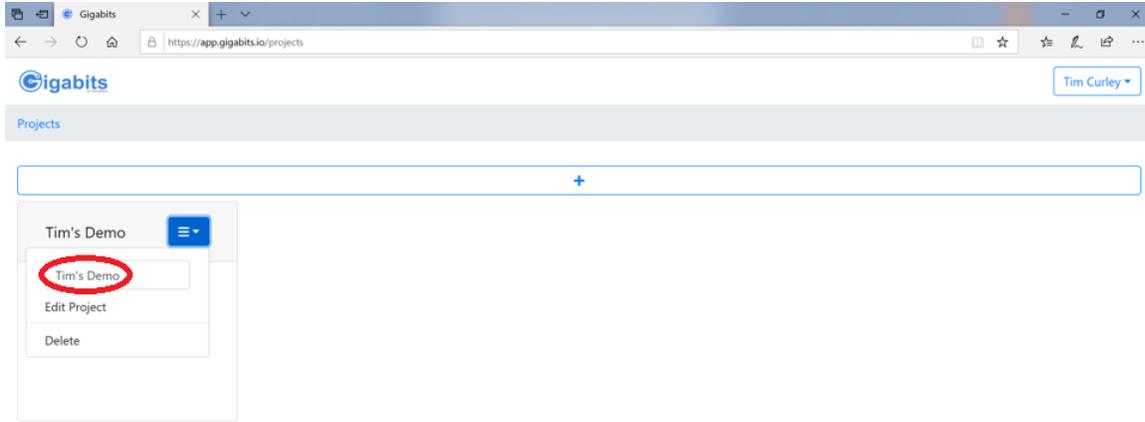

Software Step 5: Select the blue square that's next to your project's name and give your project a nice name by replacing "New Project".

Gigabits.io 2019 | IoT Simplified

Software Figure 5

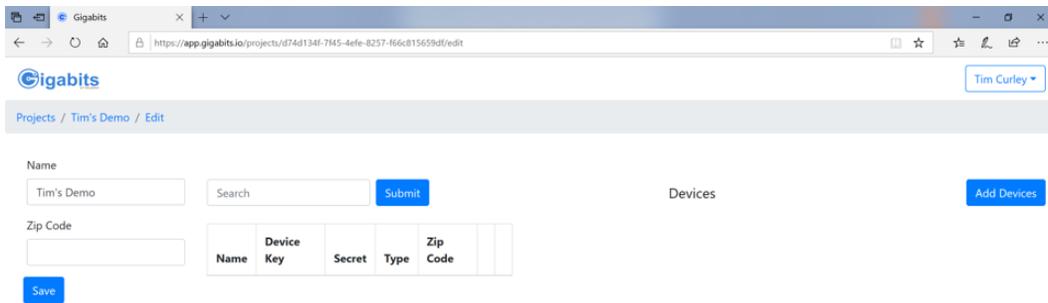

Software Step 6: Select "Edit Project" after pressing the project's blue square. This should show you the page used to edit projects.

Gigabits.io 2019 | IoT Simplified

Software Figure 6

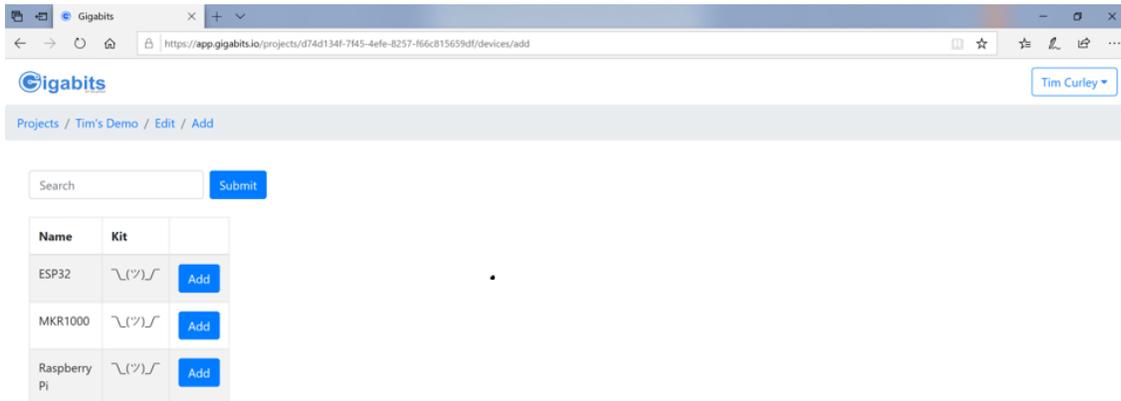

Software Step 7: Every project should have exactly one device (microcontroller). Press the blue “Add Devices” button on the far right. If you can’t see that button, make your browser window wider.

Gigabits.io 2019 | IoT Simplified

Software Figure 7

Software Step 8: Add an ESP32 device for your project.

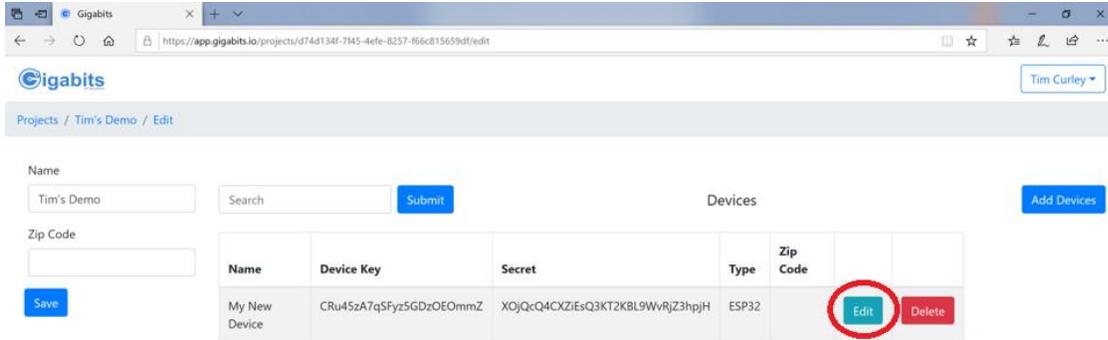

Gigabits.io 2019 | IoT Simplified

Software Figure 8

Software Step 9: If you see a mostly blank screen, try clicking on “Gigabits” in the upper left. Then select your project’s blue square and select “Edit Project”.

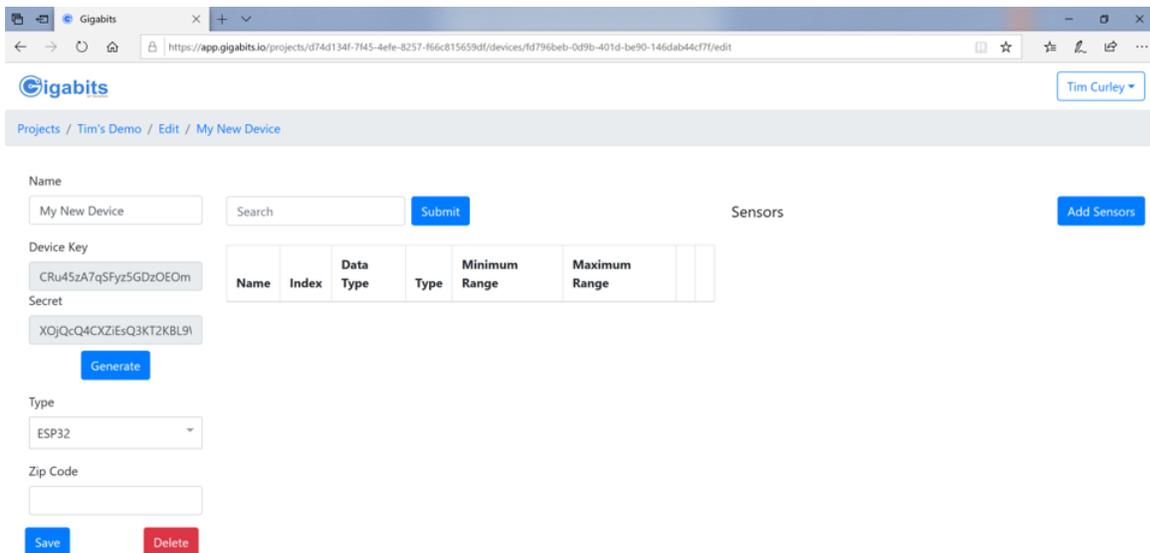

Software Step 10: You should now see the page used to edit a project. It should have a device.

Gigabits.io 2019 | IoT Simplified

Software Figure 9

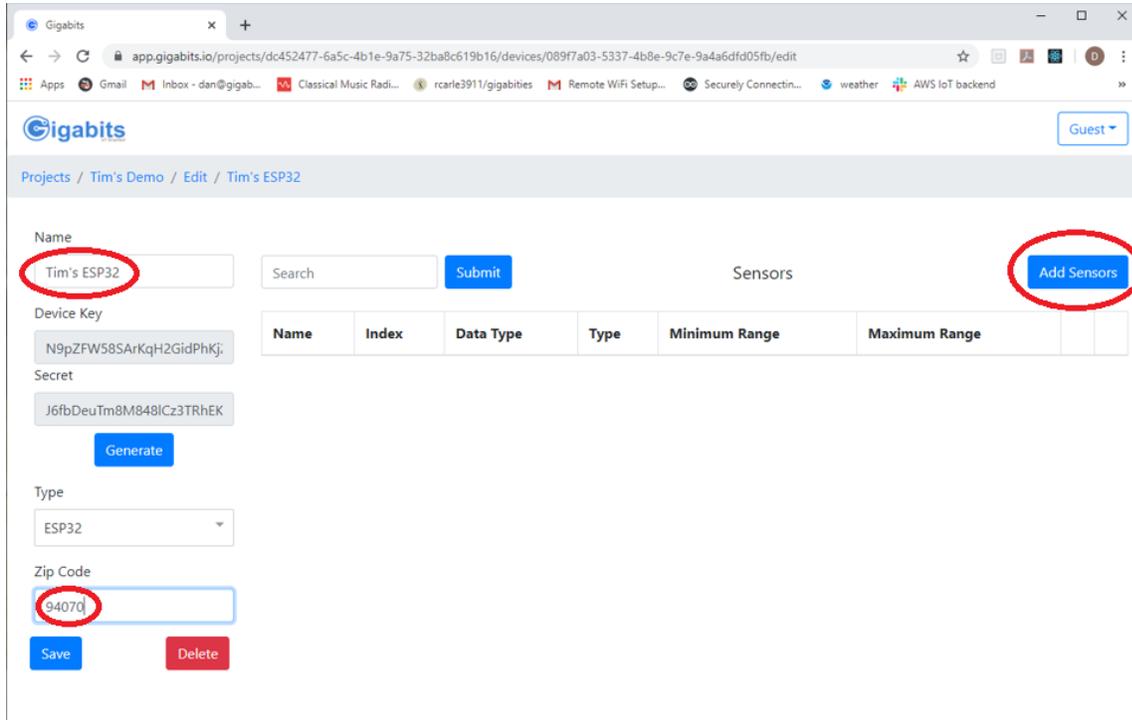

Software Step 11: Click the “Edit” button in your device’s row. This will take you to the page used to edit devices.

Gigabits.io 2019 | IoT Simplified

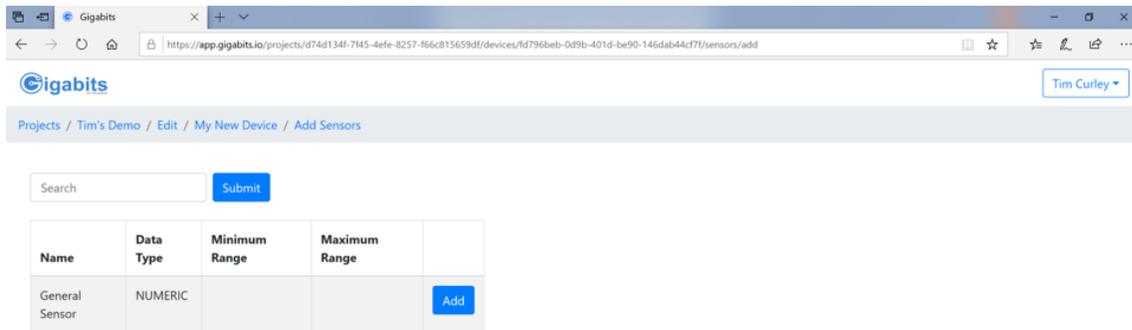

Software Figure 10

Software Step 12: Give your device a descriptive name by replacing the default (“My New Device”). Later on, we’ll want to display weather data from around the country. Fill in the Zip Code that specifies which weather you’d like to see.

Software Figure 11

Software Step 13: Add a sensor to your device by clicking on the “Add Sensors” button. This will take you to a page that describes the sensor being added.

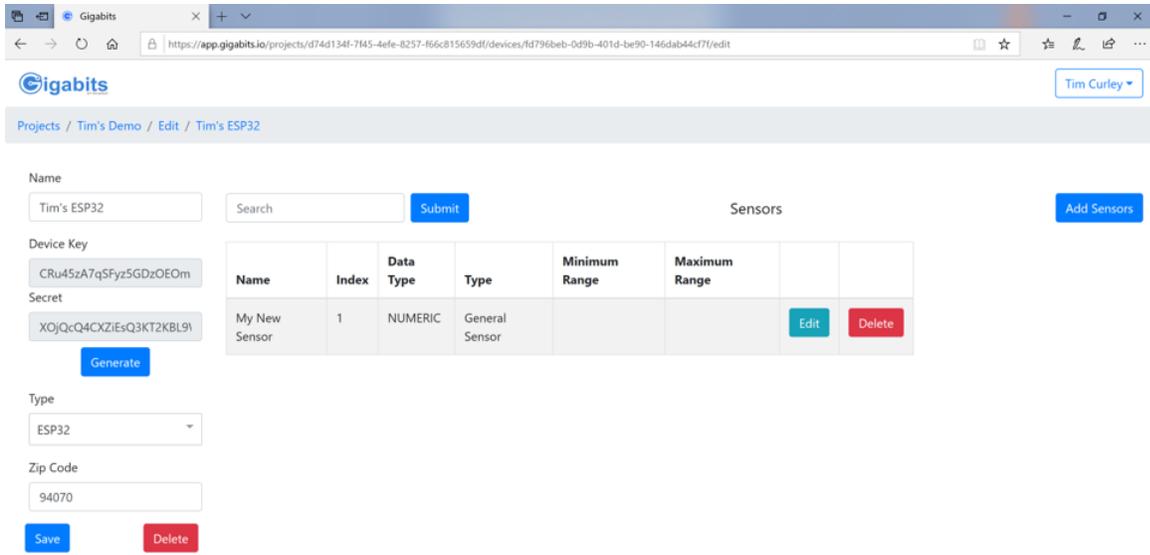

Gigabits.io 2019 | IoT Simplified

Software Figure 12

Clicking on the “Add” button will take you back to the page used to edit devices. The device will now have one sensor.

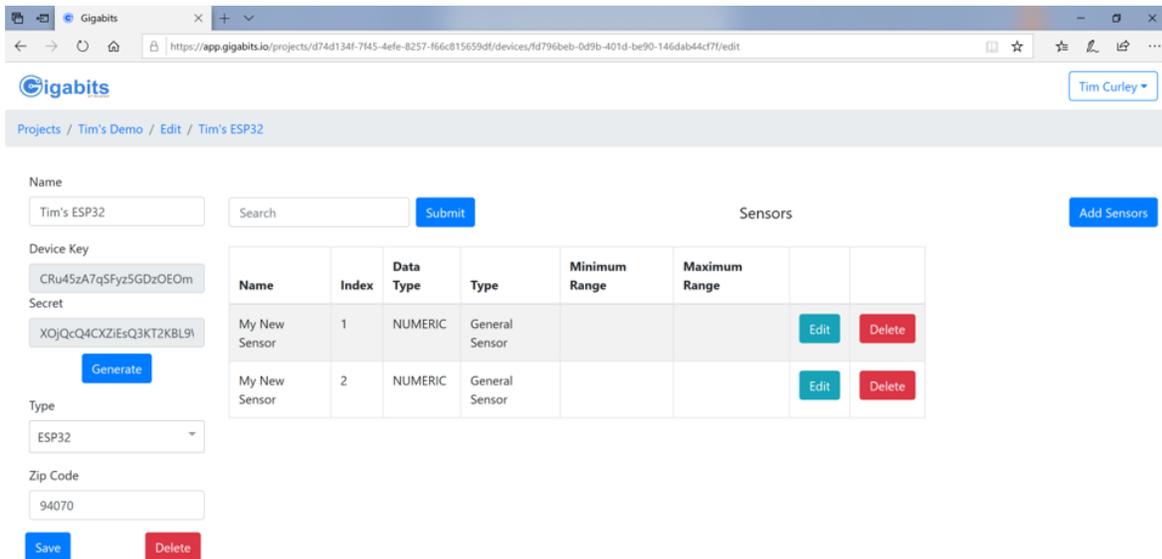

GIGABITS ESP32 MAKER PROJECT INSTRUCTIONS V.1

Gigabits.io 2019 | IoT Simplified

Software Figure 13

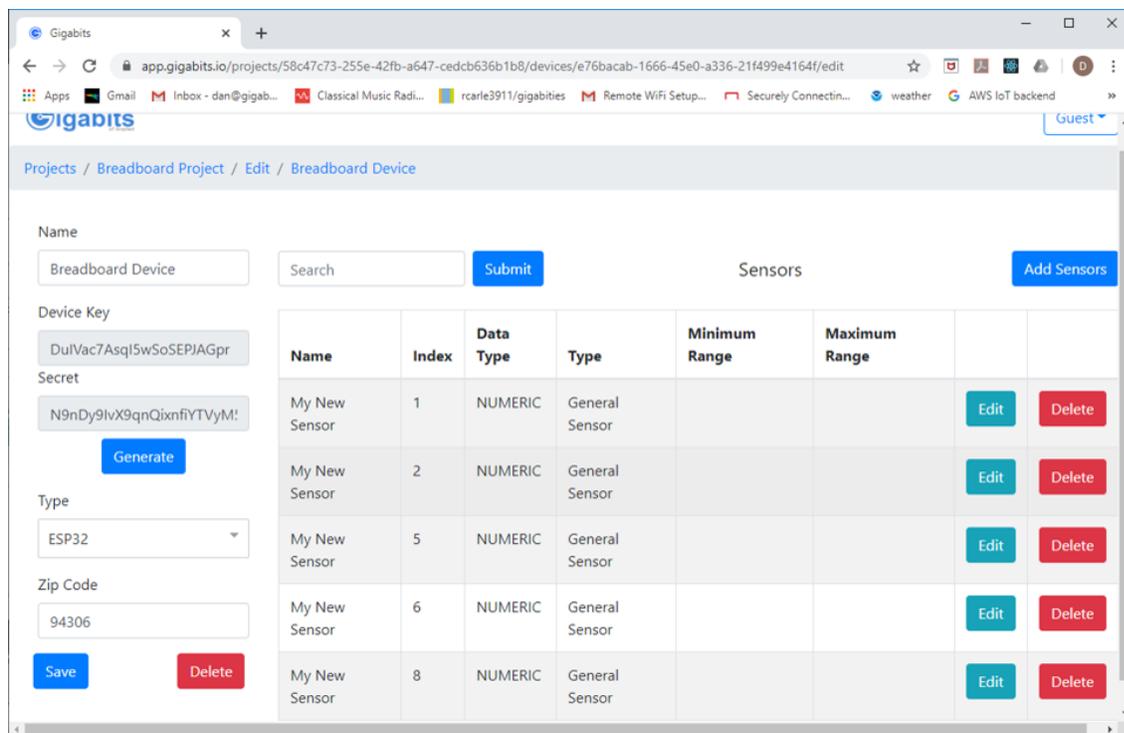

Software Step 14: Add another sensor to your device by clicking on the “Add Sensors” button again, then clicking on the “Add” button on the next page again.

Gigabits.io 2019 | IoT Simplified

Software Figure 14

Software Step 15: Repeat the “Add Sensors, Add” sequence 3 more times for a total of 5 sensors.

Software Figure 15

Software Step 16a: Go through all the sensors again. This time, give each sensor a useful name and a color. The name will have two parts. The first part describes the physical sensor type, like “HCPA-5BV-U3” or “TSL2651”. The second part is used to identify the sensor, like “HVAC, Room 1”. Each sensor type is statically assigned a number called the “sensorIndex” by the system. Each sensor value pushed to the Gigabits server is accompanied by a sensorIndex. That tells the server how to treat the value. Here is the current mapping from sensor type to sensorIndex. This will grow as sensors are added.

There’s currently a loophole that we take advantage of. As shown, each sensorIndex corresponds to a particular sensor type. The loophole is that the system doesn’t check the sensor type. That means that you can usually replace one sensor with another that has the same class of output (e.g. Numeric) and the system will dutifully display the new sensor’s output. You can use the sensor’s name to describe the actual sensor output.

Sensor Type	Sensor Index
HCPA-5V-U3, Humidity output	1
HCPA-5C-U3, Temperature output	2
Invert Display button (actuator, not sensor)	3
MPL115A2 Barometric Pressure	4
MQ2 Propane, Butane, Methane, Hydrogen, Alcohol Sensor	5
Soil Moisture Sensor	6
TMD26721 Proximity Sensor	7
TSL2561, Visible Light output	8
TSL2561, Infrared Light output	9

Table 1

Software Step 16b: While you're giving a sensor a name, you should also assign it a nice color. The color will be used to quickly identify gauges and chart lines. The mechanics of assigning a color to a sensor varies between web browsers. In all cases, you click on the color box, then use a browser-specific method to assign a color.

Software Figure 16

Software Step 16c: Here's a device with all its sensors

The screenshot shows a web browser window with the URL `app.gigabits.io/projects/58c47c73-255e-42fb-a647-cedcb636b1b8/devices/e76bacab-1666-45e0-a336-21f499e41...`. The dashboard includes a form for device configuration and a table of sensors.

Device Configuration Form:

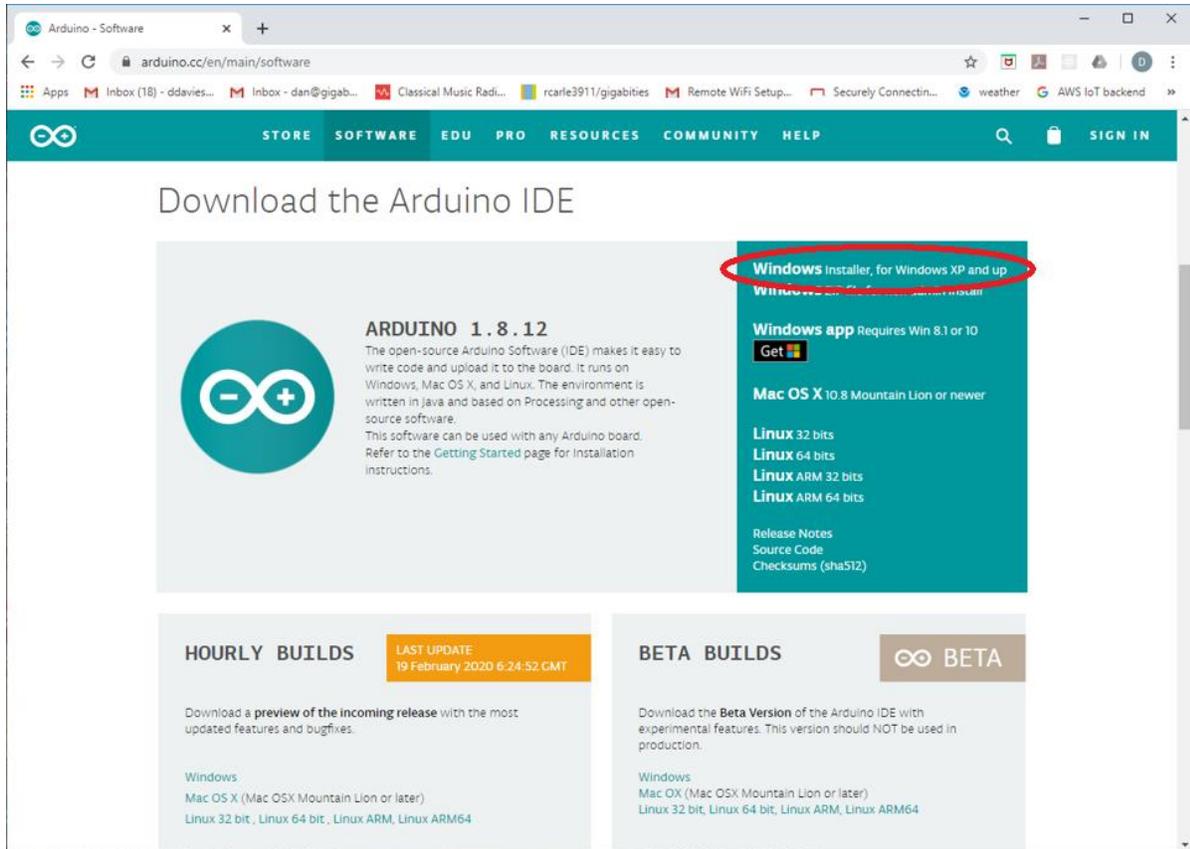

- Name: Breadboard Device
- Device Key: DulVac7Asql5wSoSEPJAGpr
- Secret: N9nDy9lvX9qnQixnfiYTVyM!
- Type: ESP32
- Zip Code: 94306

Sensors Table:

Name	Index	Data Type	Type	Minimum Range	Maximum Range	Edit	Delete
Humidity Sensor	1	NUMERIC	General Sensor			Edit	Delete
Temperature Sensor	2	NUMERIC	General Sensor			Edit	Delete
Gas Sensor	5	NUMERIC	General Sensor			Edit	Delete
Soil Sensor	6	NUMERIC	General Sensor			Edit	Delete
Visible Light Sensor	8	NUMERIC	General Sensor			Edit	Delete

Software Figure 17

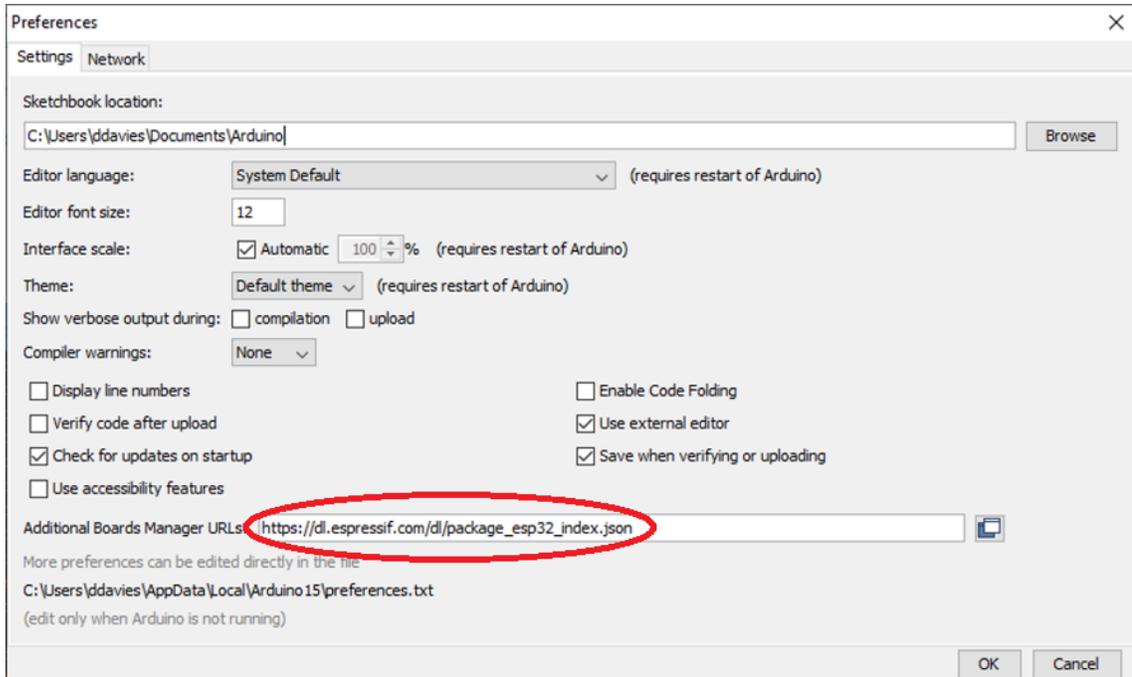

Software Step 17: Now that the dashboard is configured, we can start loading software. Start by loading the Arduino IDE. Open a web browser to <https://www.arduino.cc/en/main/software>.

Software Figure 18

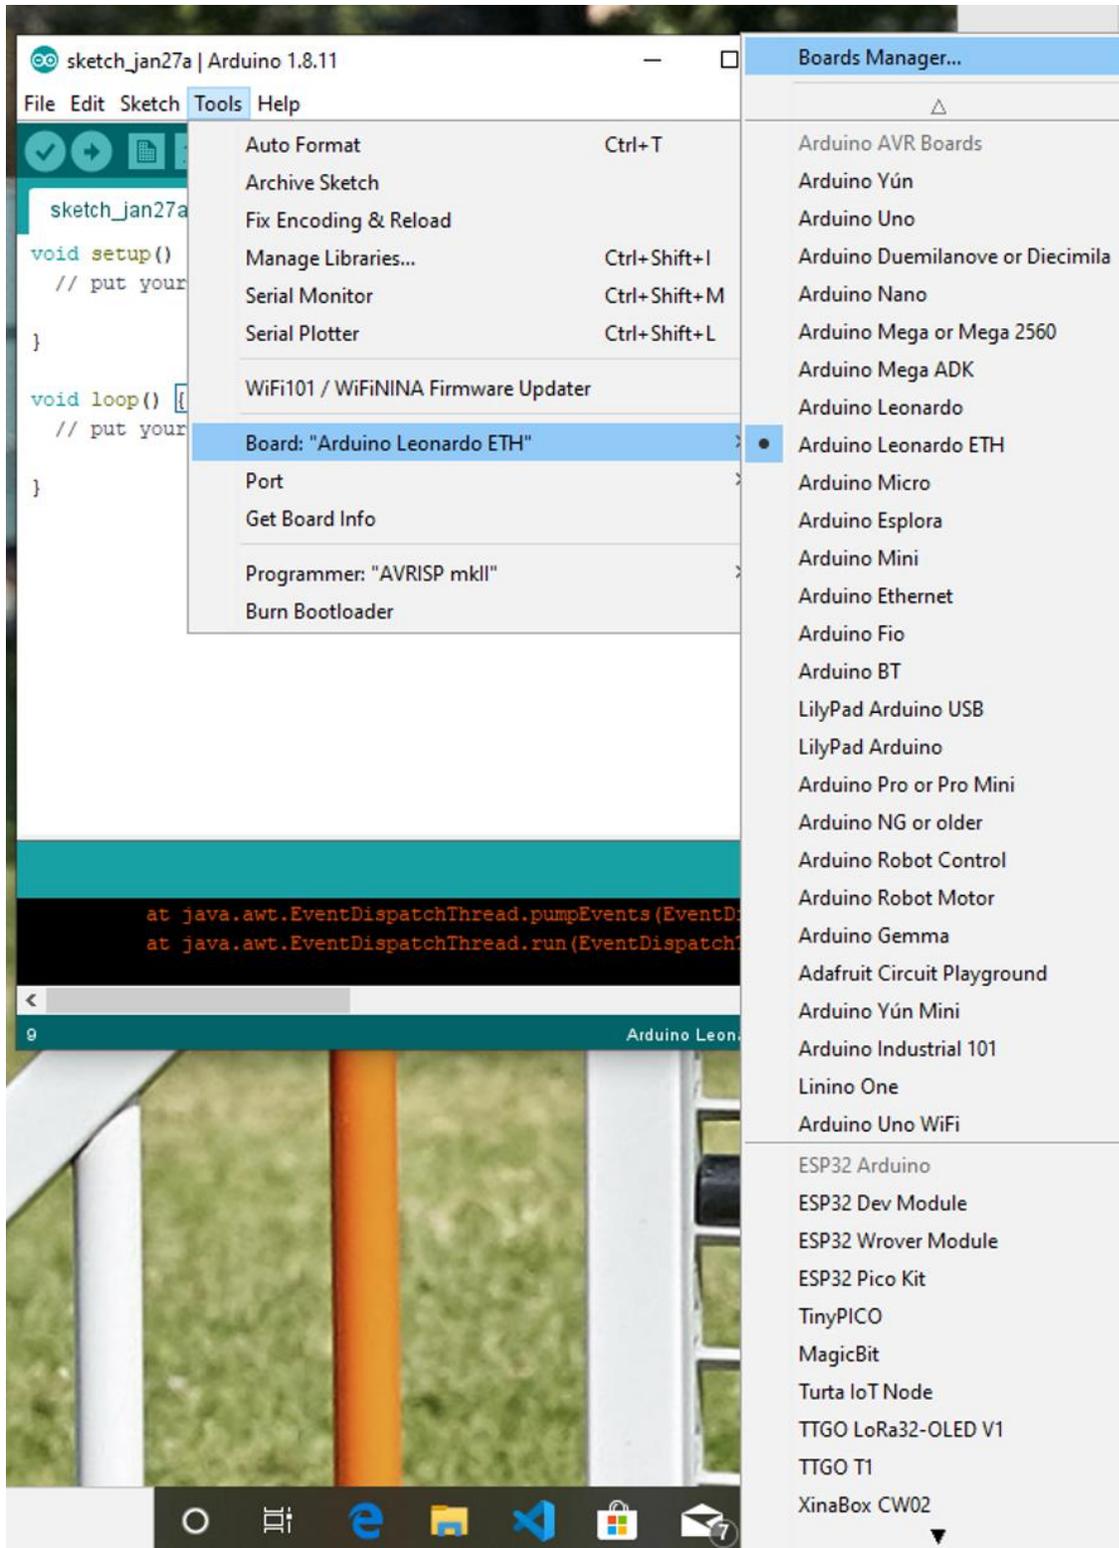

Using the script “Windows Installer, for Windows XP and up”, install a copy of the Arduino IDE.

Software Step 18: We need to load the code that links the ESP32 boards with the Arduino IDE. Open File -> Preferences. Put the string https://dl.espressif.com/dl/package_esp32_index.json into the text box labelled “Additional Boards Manager URLs:”. Close the Preferences window.

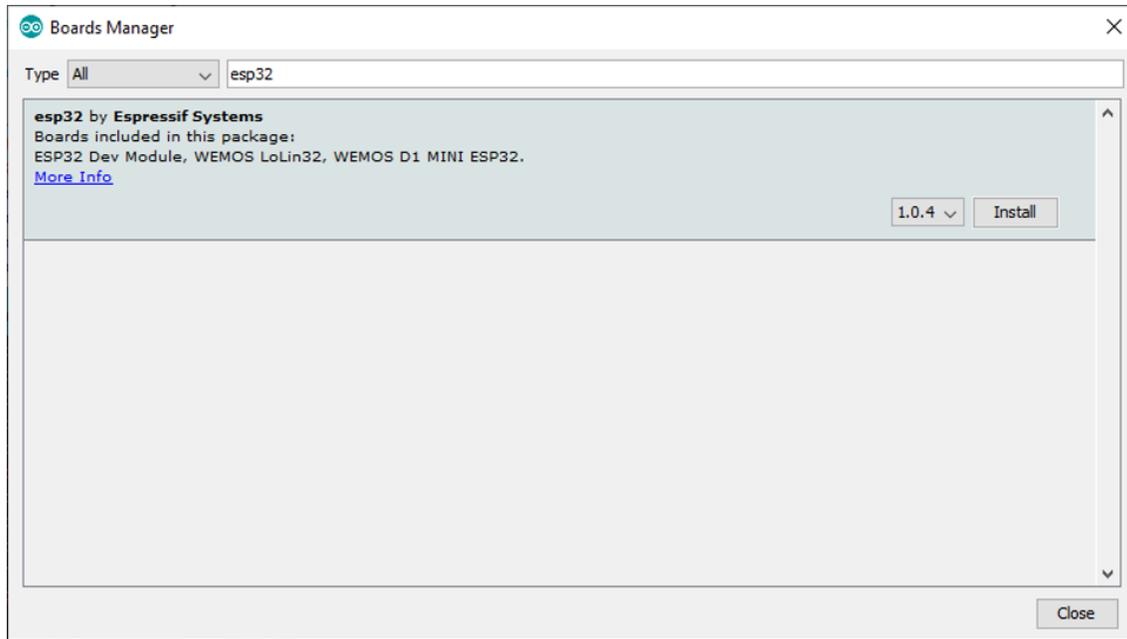

Software Figure 19

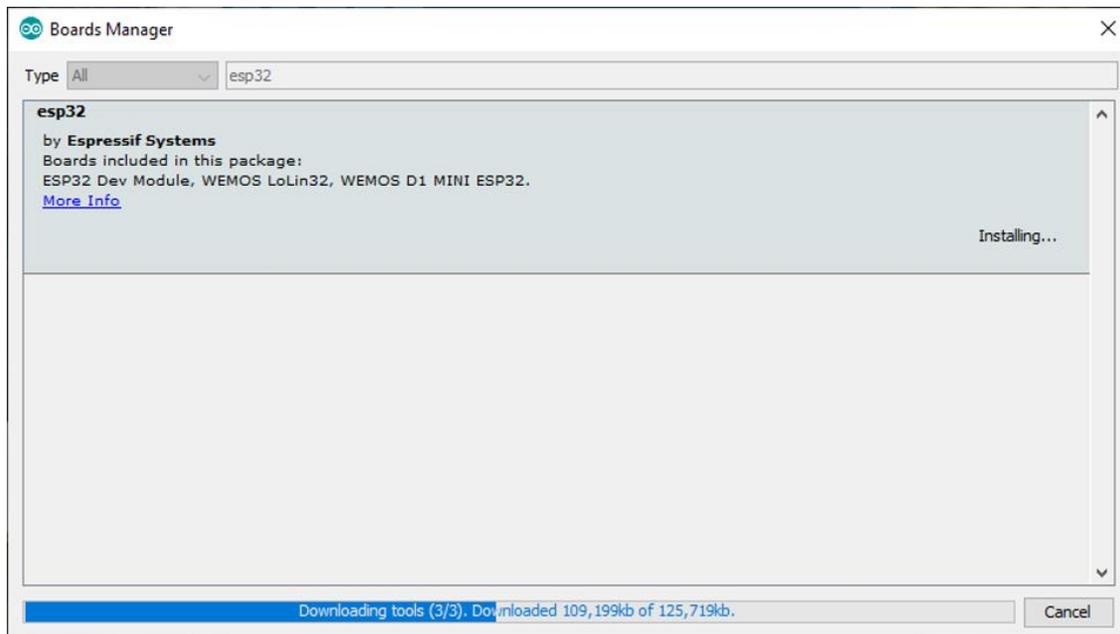

Software Step 19: Select Tools -> Board -> Boards Manager. Search for “esp32 by Espressif Systems”. Install this Board package. It will take a few minutes. It may ask if it can modify your PC. Say yes.

Software Figure 20

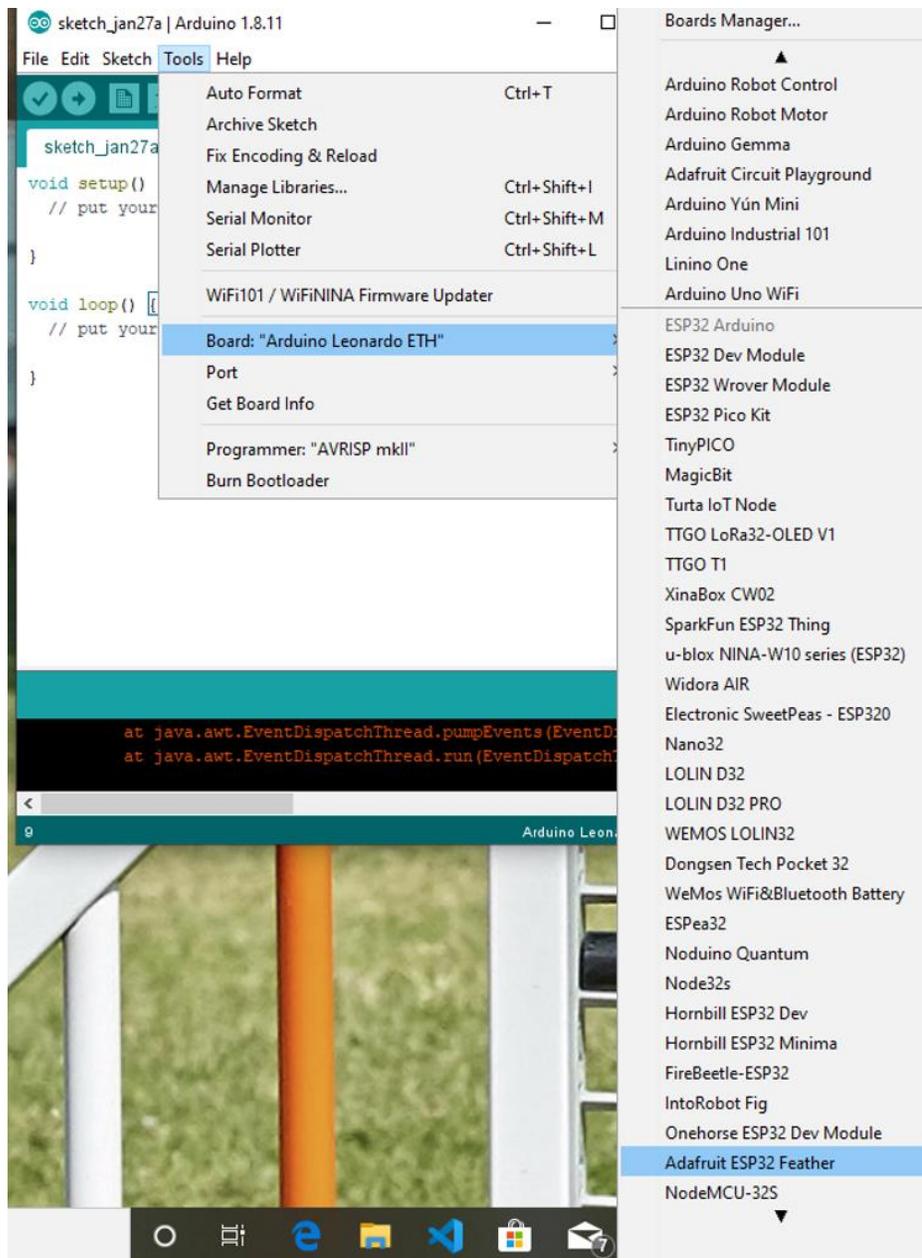

Software Figure 21

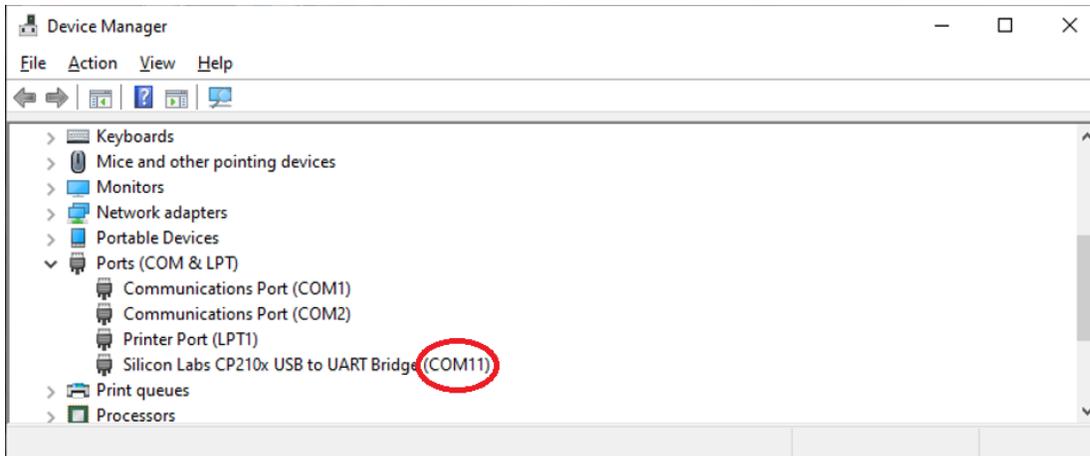

Software Figure 22

Software Step 20: The “esp32” package that you just installed includes many boards. In Tools -> Board, choose the board named “Adafruit ESP32 Feather”. In theory, it hardly matters what board you choose. In practice, we haven’t found another board that works with the ESP32 device and adaptor from NCD.

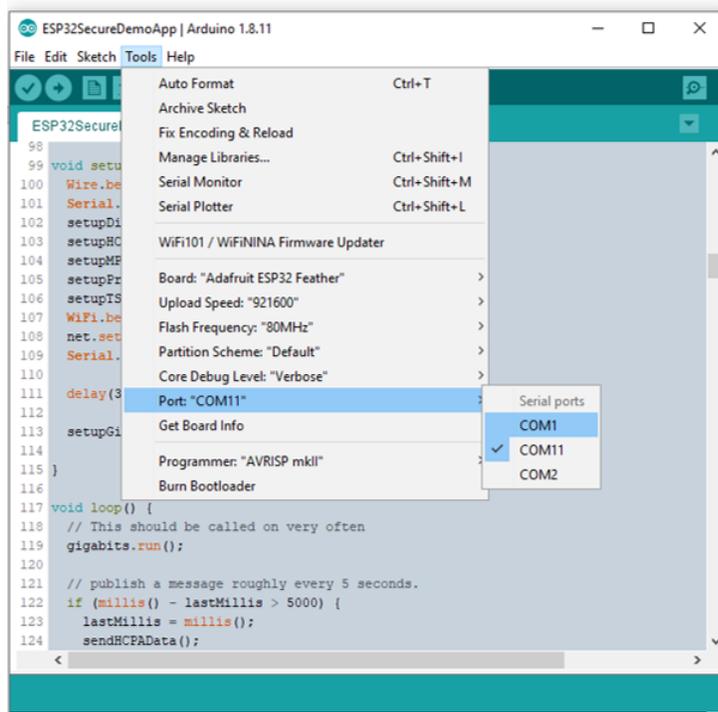

Software Figure 23

Software Step 21: Open the Windows Device Manager (On Windows 10, search for “Device Manager”). Scroll down to “Ports (COM & LPT)”. There should be a port with an interesting name, like “Silicon Labs CP210x USB to UART Bridge (COM<a number>)”. In this example, the number is 11. Any number other than 1 or 2 should work.

Software Figure 24

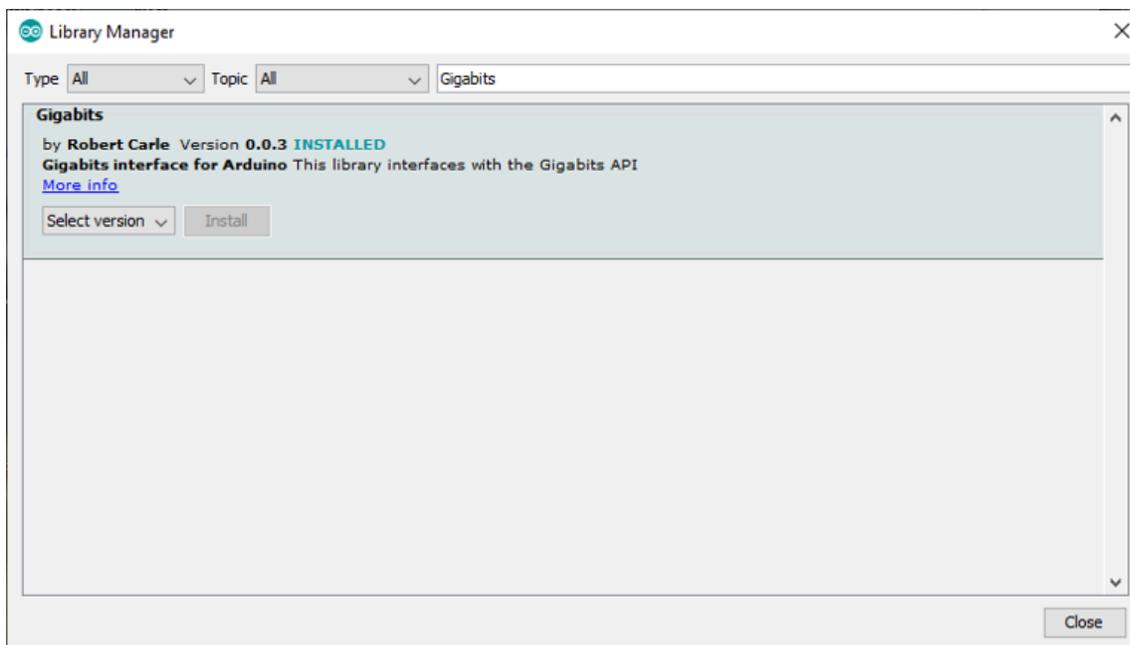

Software Step 22a: That's the Windows COM port that we'll use to communicate with our board. Back in the Arduino IDE, go to Tools -> Port and make sure the port shown is the port from the Device Manager.

Software Figure 25

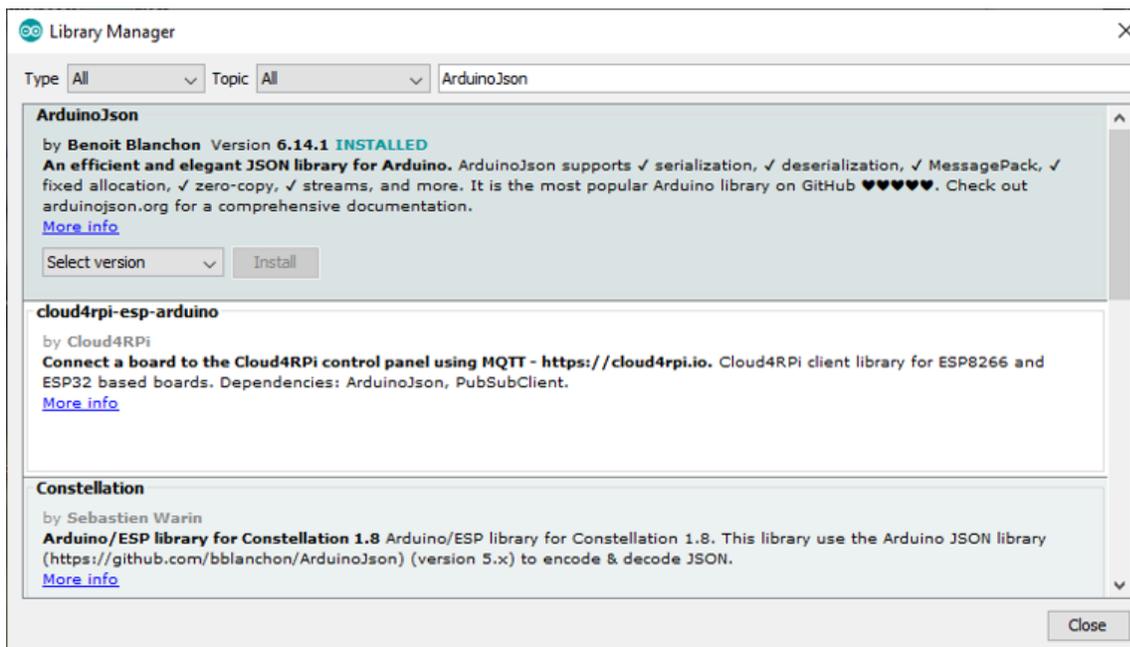

Software Step 22b: If not, press Tools -> Port and select the port from the list of ports. If you don't see your port's name, make sure the ESP32 is turned on and connected. If that's not the problem, try going into the Device Manager again, go down to Ports, right-click on the interesting one and select "Update Driver". If it's still not working, you might installing the drivers from <https://www.silabs.com/products/development-tools/software/usb-to-uart-bridge-vcp-drivers>.

Software Step 23a: Use your Arduino IDE to fetch the "Gigabits" library (Sketch -> Include Library -> Library Manager; search for Gigabits). Press its "Install" button.

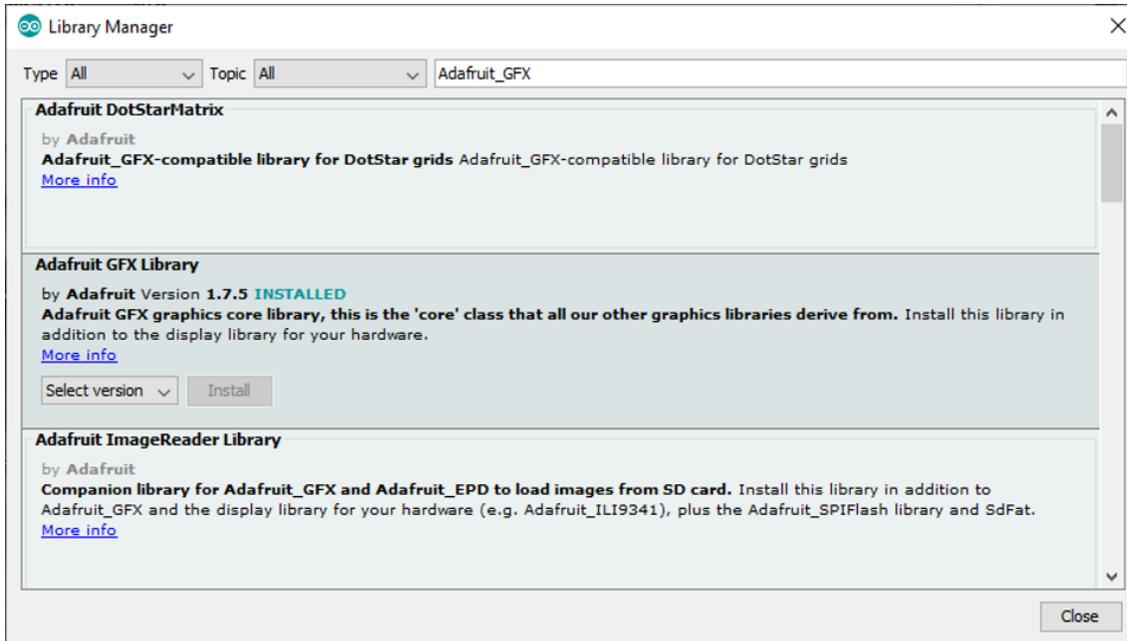

Software Figure 26

Software Step 23b: Install the “ArduinoJson” library.

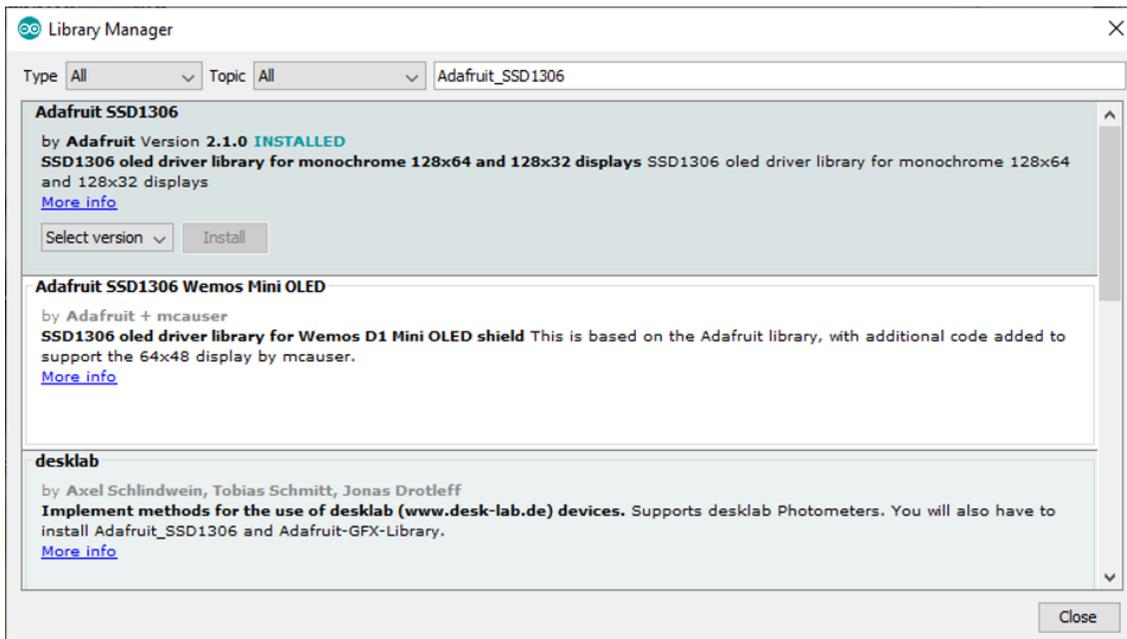

Software Figure 27

Software Step 23c: Install the “Adafruit_GFX” library.

Software Figure 28

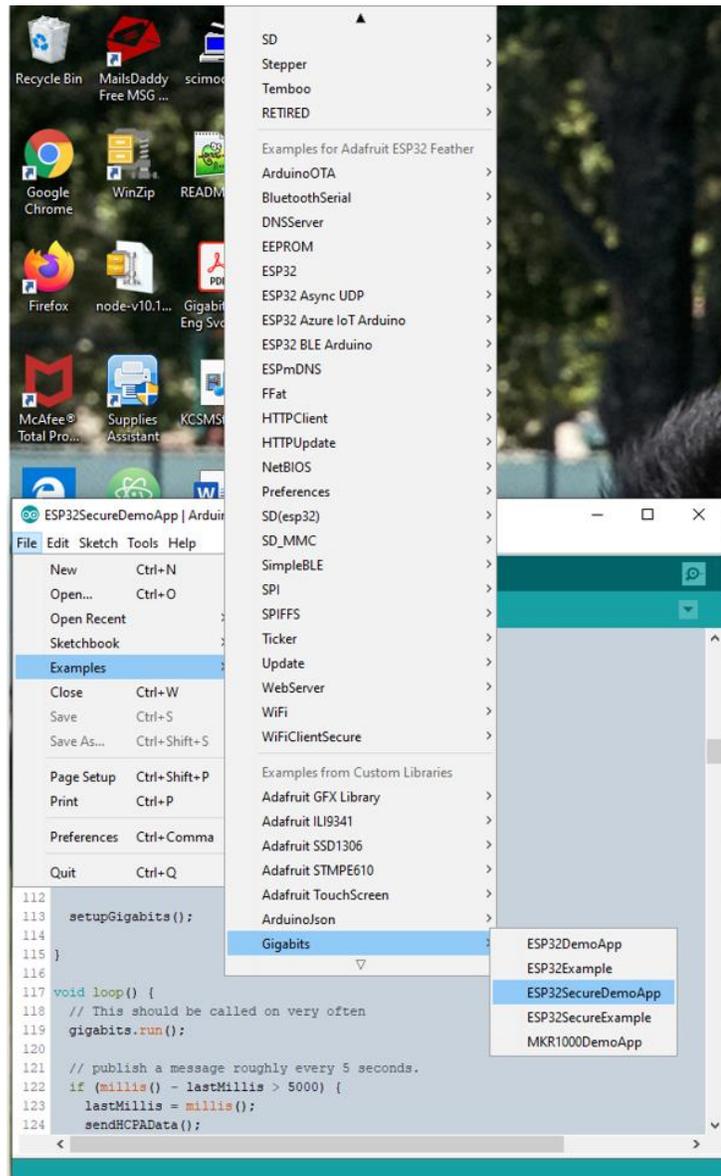

Software Step 23d: Install the “Adafruit_SSD1306” library. Close the Library Manager window.

Software Figure 29

Software Step 24: It’s finally time to open the sketch (a program written in Arduino language). If you’re writing your own sketch, you can use the rest of these instructions for inspiration. The important parts are including Gigabits.h, calling WiFi.begin with your router’s ssid and password, calling gigabits.begin with your device’s device key and secret (see below) and calling gigabits.sendRecord each time you want to send a sensor value to the server.

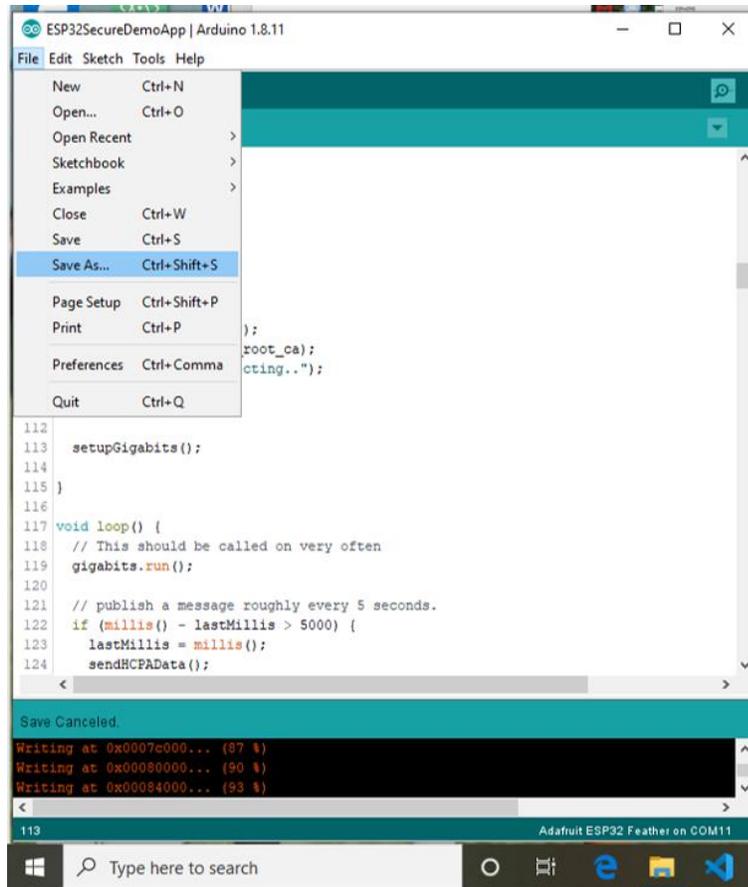

Software Step 25: Using the Arduino IDE, select File -> Examples -> Gigabits. Load the folder named “ESP32SecureDemoApp”.

Software Figure 30

At this point, there will be two Arduino IDE windows open. Close the one that we didn't just open.

Software Step 26: We're going to modify the sketch inside that folder. We can't do that from where the folder is now because the directory is read-only. From the Arduino IDE, select "File -> Save As" to write the sketched elsewhere. Saving it on the user's desktop is convenient. That's at C:\Users\\Desktop

Software Figure 31

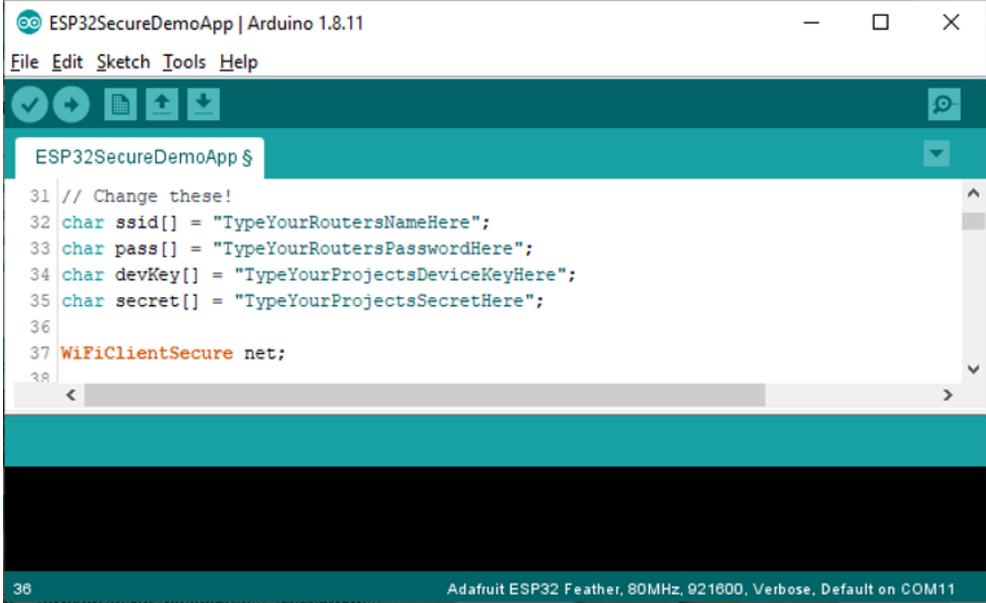

Software Step 27: In the version of ESPSecureDemoApp.ino that you just copied from the user's desktop, scroll down until you get to a line that says "Change these!"

Software Figure 32

Change "ssid" to your router's name. Similarly, replace "pass" with your router's password.

Software Step 28: Way back up above, we declared a project that contained some devices. In the dashboard, go to Projects -> <your project's name> -> Edit. The project's "Device Key" and "Secret" are shown. Copy the Device Key for the project and insert it in place of "devkey" in our sketch. Similarly, replace the sketch's Secret with the project's secret.

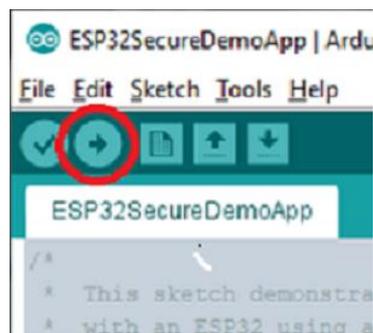

```

ESP32SecureDemoApp | Arduino 1.8.11

ESP32SecureDemoApp $
31 // Change these!
32 char ssid[] = "TypeYourRoutersNameHere";
33 char pass[] = "TypeYourRoutersPasswordHere";
34 char devKey[] = "TypeYourProjectsDeviceKeyHere";
35 char secret[] = "TypeYourProjectsSecretHere";
36
37 WiFiClientSecure net;
38
36 Adafruit ESP32 Feather, 80MHz, 921600, Verbose, Default on COM11

```

Software Figure 33

Software Step 29: Finally, press the Compile and Upload button (in the upper left of the Arduino IDE window, it looks like an arrow facing to the right).

Software Figure 34

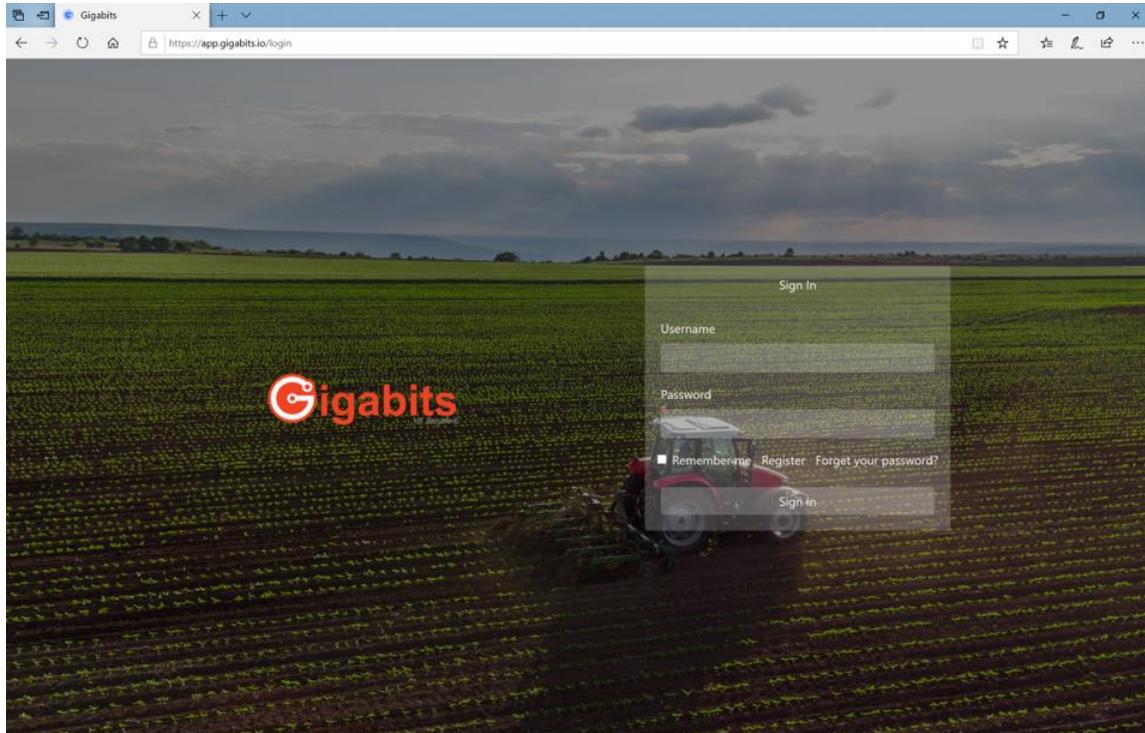

This will compile the sketch and start running it. It should start pumping sensor data to the dashboard. You should be able to see this on the Serial Monitor. You can open the Serial Monitor by selecting "Tools -> Serial Monitor"

You've completed the Gigabits setup and are ready to start configuring your dashboard's gauges and charts!

Set up your Dashboard

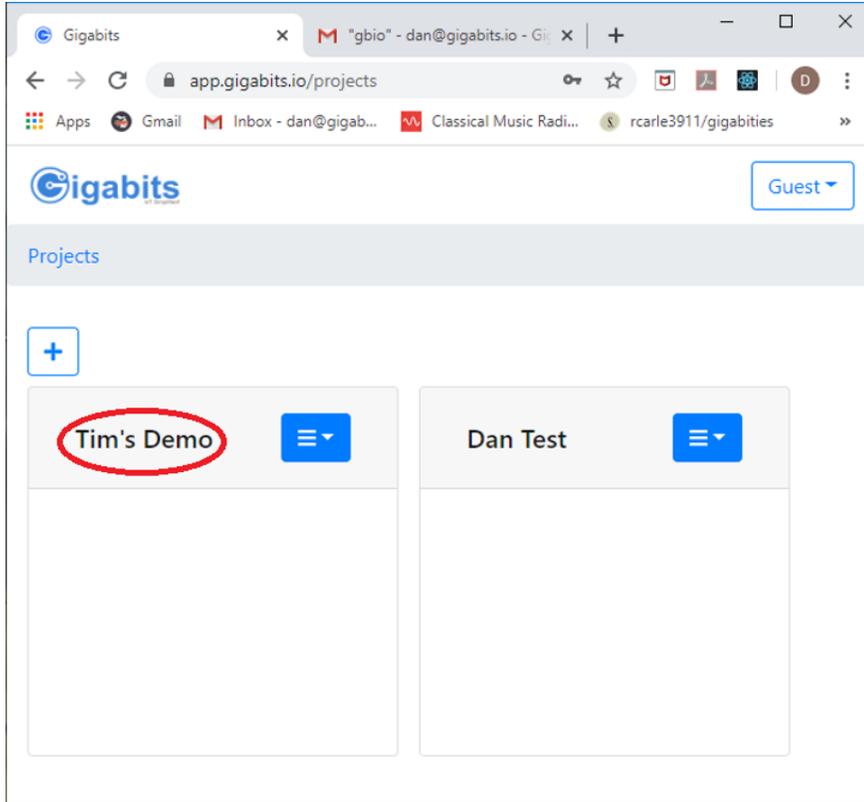

In this section, we will show how to set up charts, gauges and command buttons.

Dashboard Step 1: Open a web browser to “app.gigabits.io”

Dashboard Figure 1

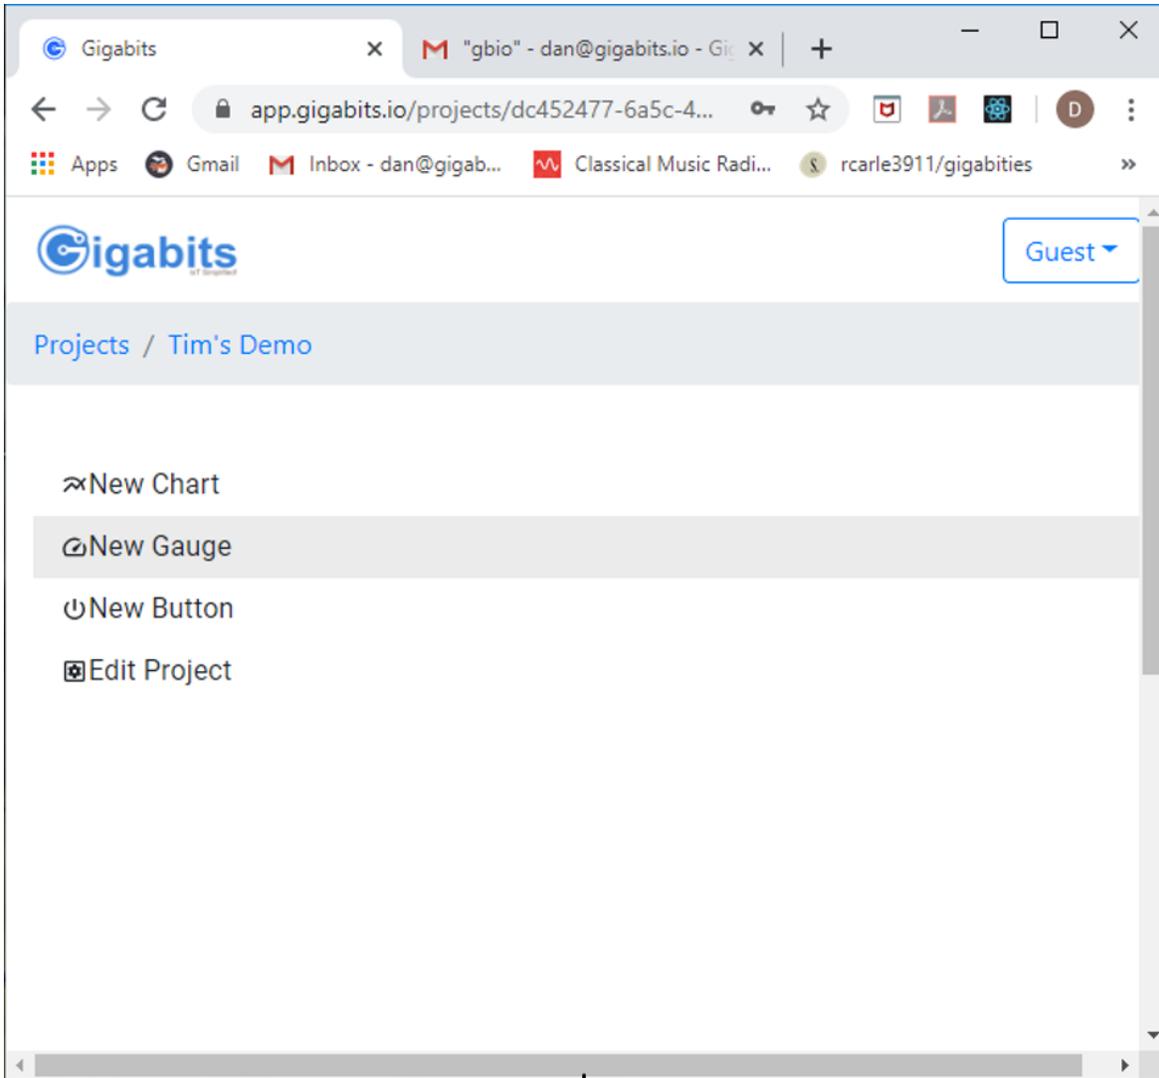

Sign in. That should take you to the Projects page.

Dashboard Figure 2

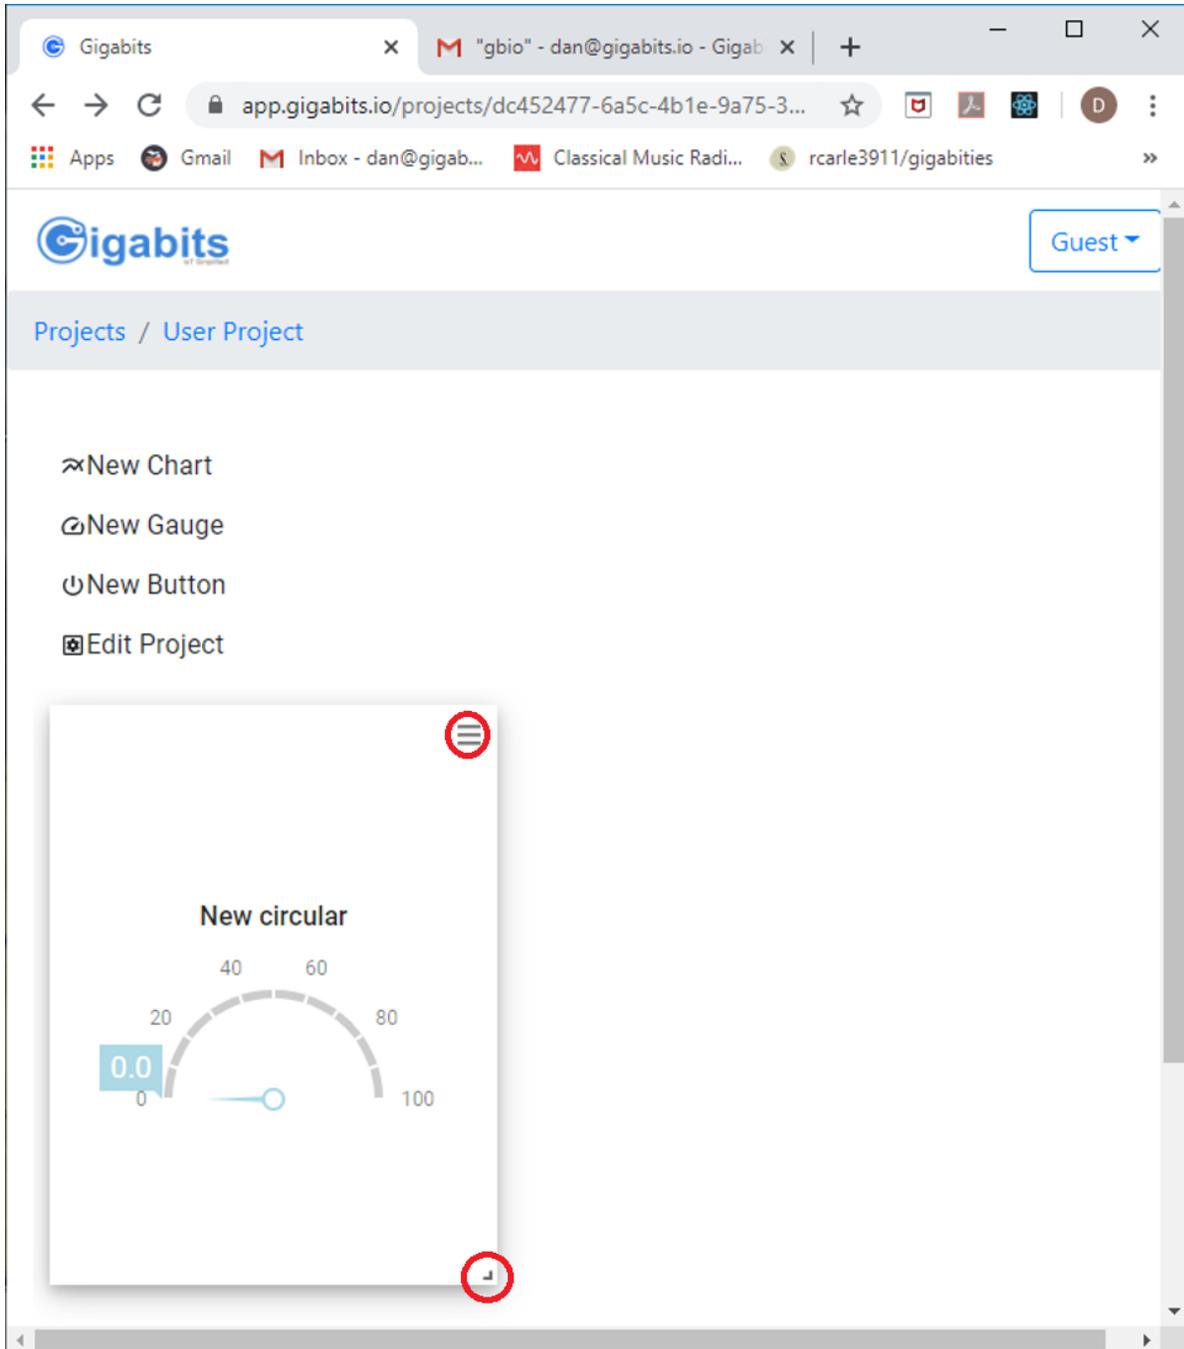

Dashboard Step 2: Click on the name of the project whose dashboard we'll set up. It's important to click on the project name, not the blue square next to that name. If you're following our example, click on the name "Tim's Demo", not the blue square next to "Tim's Demo".

Dashboard Step 3: On the left side of the User Project page, there are four commands New Chart, New Gauge, New Button and Edit Project. If the commands are chopped off, try making the browser window wider or narrower.

Dashboard Figure 3

Dashboard Step 4: Let's start by making a new gauge. A gauge shows a sensor's current value. Click on the "New Gauge" command. A gauge will appear on the left side of the dashboard. It will be below the lowest gauge, chart or button, which can make it tricky to find because that location is often off the bottom of the screen.

Dashboard Figure 4

The gauge can be resized by dragging the tiny chevron in the bottom/right corner of the gauge. The gauge will have a configuration icon (three horizontal lines). Press the icon to configure the gauge.

Dashboard Step 5: The next page shows the settings for an unconfigured page. One of the first things to notice is that pressing the Delete button deletes the gauge.

Dashboard Figure 6

Dashboard Step 7: To position the gauge on the dashboard, simply drag it around with the cursor. Dashboard items must be at the top of the dashboard or immediately under another item.

Dashboard Figure 7

Dashboard Step 8: You can also use gauges to display data from external databases. To illustrate this, Gigabits can display weather data. Go to your project and choose New Gauge. Press the new gauge’s configuration icon. This time, click on the “External” tab at the top of Settings page. The only choice for “Source” is currently “Open Weather”. There are 3 data types, Temperature, Humidity and Barometric Pressure. Pick an informative name. The weather data is for a US Zip Code. That Zip Code was chosen when the project was created. You can also select a nice color for the gauge, minimum and maximum values and a Unit of Measurement. Here is the Settings page for data from Open Weather.
